Describing a Robot

Maciej Kujawa

I would like to describe Atlas, a humanoid robot made by the American company Boston Dynamics. Its new electric version was introduced in 2024. Atlas is designed to help people in factories. It can walk, lift heavy objects and move car parts. It is able to use cameras and sensors to understand its surroundings. Atlas is also capable of changing its own battery when it needs more power. It has the ability to learn new tasks and work with little human supervision. In my opinion, Atlas is impressive because it combines advanced movement with useful industrial skills. This technology could make manufacturing safer and more efficient in the near future.
