Describing a Job

Maciej Kujawa

I work as an electronics engineer in the Research and Development (R&D) department at Eaton in Tczew, Poland. My main responsibility is to design and improve electronic circuits and printed circuit boards (PCBs). I also design and assemble test setups to check how our devices work in different conditions. I perform measurements, analyse the results and prepare technical reports. Another important part of my job is building mathematical models of electronic systems to predict their behaviour. I work closely with other engineers to solve problems and improve product reliability. I need to be precise, creative and well organised. I enjoy my job because every project brings new technical challenges.
